

GATHERING BONAIVIST BEANS IN SOUTHERN FLORIDA. (DOLICHOS LABLAB L., S. P. I. NO. 47977.)

The bonavist bean is a perennial rank-growing species which forms a satisfactory ground cover in orchards. It produces its pods clustered on short erect stalks which project above the foliage, making them easy to gather. Its beans, both when young and green and when dried, are an excellent vegetable which deserves to be known in all frostless regions where the plant will grow. (Photographed by David Fairchild, Miami, Fla., February 11, 1919; P25266.)
