

**SOME OF MR. ROCK'S INTRODUCTIONS FROM YUNNAN.**

The plants collected by Agricultural Explorer J. F. Rock in the remote Province of Yunnan, southwestern China, are being propagated in the United States and distributed to experimenters for trial. Mr. Rock has sent in large quantities of seeds, including many interesting species of *Pyrus*, *Malus*, and other genera well known in the Temperate Zone. The above illustration shows several rows in the nursery at the Plant Introduction Garden, Bell, Md., where these plants have been grown during the past summer; on the left is an undetermined species of *Sorbaria*, in the right center (two rows) a species of *Photinia*, and on the extreme right a *Pyracantha*. (Photographed by Wilson Popenoe, August 27, 1923; P35030FS.)
