(*C. sinensis* × *C. paradisi*). Apparently a natural cross which was developed from a nucellar embryo because there is very little, if any, difference between the parent and the seedlings. Fruits are borne singly, on ends of branches and compare in size with grapefruit, shape globose to pyriform; rind much like a grapefruit in aroma and color. The inner white pulp is not bitter; segments nine to eleven, adhere only slightly to the rind. The mild-flavored sweet juice is neither acid nor bitter but combines the flavor of the orange and grapefruit.
